

BloodLink — Evidence of Testing

Field	Value
Project	BloodLink — Blood Bank Management System
Version	2.0
Date	May 1, 2026
Author	BloodLink QA Team

1. Overview

This document provides evidence of testing for the BloodLink platform, demonstrating that all test levels have been executed successfully. Evidence includes screenshots from test execution tools, CI/CD pipeline logs, and coverage reports.

2. Unit Test Evidence

2.1 Test Execution — Jest (53 Tests, 6 Suites)

Unit tests are run via `npm run test` in the `backend/` directory using Jest 30 with `ts-jest`.

Test Suites:

Suite	File	Tests	Status
AppController	<code>app.controller.spec.ts</code>	1	✓ PASS
AuthService	<code>auth/auth.service.spec.ts</code>	7	✓ PASS
DonorsService	<code>donors/donors.service.spec.ts</code>	15	✓ PASS
EmergenciesService	<code>emergencies/emergencies.service.spec.ts</code>	13	✓ PASS
InventoryService	<code>inventory/inventory.service.spec.ts</code>	7	✓ PASS
NotificationsService	<code>notifications/notifications.service.spec.ts</code>	9	✓ PASS
Total	—	52	✓ ALL PASS

2.2 Coverage Report Summary

Coverage generated via `npm run test:cov` (Jest `--coverage` flag).

Module	Statements	Branches	Functions	Lines
<code>auth.service.ts</code>	100%	85.71%	100%	100%
<code>emergencies.service.ts</code>	75%	46.42%	91.66%	82.6%
<code>notifications.service.ts</code>	80.64%	70%	87.5%	80.76%
<code>donors.service.ts</code>	40.35%	29.16%	75%	46.51%
<code>inventory.service.ts</code>	37.5%	42.3%	42.85%	34.37%
<code>app.service.ts</code>	100%	100%	100%	100%

Note: Lower coverage in donors/inventory services is expected — `findAll()` methods with complex QueryBuilder chains require a live database for full path coverage. All business-critical logic paths (compatibility matrix, status boundaries,

matching engine scoring) are fully covered.

3. Integration Test Evidence

3.1 Test Execution — Jest + Supertest (28 Tests, 5 Suites)

Integration tests verify the full HTTP → controller → service pipeline using Supertest against bootstrapped NestJS modules. Run via `npm run test:e2e` in the `backend/` directory.

Test Suites:

Suite	File	Tests	Status
Auth Workflow	test/auth.integration-spec.ts	5	✓ PASS
Donors Workflow	test/donors.integration-spec.ts	6	✓ PASS
Inventory Workflow	test/inventory.integration-spec.ts	6	✓ PASS
Emergency Workflow	test/emergencies.integration-spec.ts	6	✓ PASS
Notifications Workflow	test/notifications.integration-spec.ts	5	✓ PASS
App Controller	test/app.e2e-spec.ts	1	✓ PASS
Total	—	29	✓ ALL PASS

3.2 Key Integration Flows Verified

Flow	Endpoint Chain	Result
Login → JWT → Profile	POST /login → GET /me with Bearer token	✓ Token issued, profile returned
Emergency Lifecycle	POST → GET /match → POST /notify → PATCH /resolve	✓ Full lifecycle works
Inventory Auto-Status	POST with units=10 → auto-status=CRITICAL	✓ Status calculated correctly
Donor Toggle	PATCH /toggle-availability	✓ Availability flipped
Auth Guard	GET /me without token	✓ Returns 403 Forbidden

4. CI/CD Pipeline Evidence

4.1 GitHub Actions Workflow — Passing Build

The CI pipeline is configured in `.github/workflows/test.yml` and runs automatically on every push and pull request to the `main` branch.

Screenshot: GitHub Actions — Build #5 (All Steps Passing)

Pipeline Details:

Step	Status	Duration
Set up job	✓ Passed	1s
Checkout Repository	✓ Passed	1s
Setup Node.js	✓ Passed	2s
Install Backend Dependencies	✓ Passed	8s
Run Backend Unit Tests with Coverage	✓ Passed	7s
Verify Coverage Threshold	✓ Passed	0s
Run Integration Tests	✓ Passed	~5s
Post Setup Node.js	✓ Passed	0s
Post Checkout Repository	✓ Passed	0s
Complete job	✓ Passed	0s

Build: Merge pull request #4 from hamdy-fathi/test — Run #5 **Result:** ✓ All steps passed, total duration ~20s

5. System (E2E) Test Evidence — Cypress

5.1 Cypress Test Runner — 4/4 Tests Passing

System-level E2E tests are executed using Cypress 14 against the live frontend (localhost:3000) and backend (localhost:3001).

Screenshot: Cypress Test Runner — All 4 System Tests Passing

Test Results:

#	Test Case	Status	Notes
1	should display the dashboard with correct stats	✓ Pass	Verified "Platform Overview", "Emergencies", "Inventory" visible
2	should navigate to Inventory and check stock levels	✓ Pass	URL navigated to <code>/inventory</code> , headers verified
3	should toggle user profile menu	✓ Pass	Avatar "HA" clicked, "My Profile" and "Sign Out" visible
4	should create a new emergency request and find matches	✓ Pass	Form filled, submitted, toast "Emergency Created" displayed, Matching Engine loaded

Right Panel: Shows the Emergencies page after Test #4 execution — multiple "Cypress Emergency Hospital" entries created during test runs, confirming the create flow works end-to-end.

6. Test Artifacts Summary

Artifact	Location	Description
Unit Test Specs (6 files)	<code>backend/src/**/*.spec.ts</code>	52 Jest unit tests covering all 5 modules
Integration Test Specs (5 files)	<code>backend/test/*.integration-spec.ts</code>	28 Supertest integration tests covering all 5 API modules
Cypress E2E Spec	<code>frontend/cypress/e2e/bloodlink.cy.ts</code>	4 system-level browser tests
CI/CD Workflow	<code>.github/workflows/test.yml</code>	GitHub Actions pipeline with unit + integration tests
Coverage Report	<code>backend/coverage/</code>	HTML coverage report (generated on CI)
Cypress Screenshot	<code>evidence/cypress_system_test.png</code>	E2E test runner results
CI Screenshot	<code>evidence/Testcase_ym1.png</code>	GitHub Actions pipeline results

7. Conclusion

All test levels have been executed and verified:

- **52 unit tests** — All passing across Auth, Donors, Inventory, Emergencies, and Notifications modules
- **28 integration tests** — All passing via Supertest, verifying the full HTTP → controller → service pipeline for all 5 API modules
- **4 system E2E tests** — All passing via Cypress, covering dashboard, inventory navigation, profile menu, and the full emergency creation + matching engine workflow
- **CI/CD pipeline** — Fully operational on GitHub Actions, running unit tests with coverage + integration tests on every push/PR to `main`
